

ADVANCING HIV CARE THROUGH CLINICAL RESEARCH

Clinical research continues to play a pivotal role in transforming HIV from a life-threatening illness into a manageable chronic condition. As a physician, your engagement in HIV research — whether through referrals, collaboration, or direct participation — is vital to the ongoing progress in prevention, treatment, and potential cure strategies.

WHY IT MATTERS:

- **Innovative Therapies:** New long-acting injectables, broadly neutralizing antibodies (bNAbs), and gene-editing approaches are under active investigation.
- **Prevention Advances:** Ongoing studies are refining PrEP strategies, including on-demand and injectable options for diverse populations.
- **Cure Research:** Investigational trials targeting HIV reservoirs and immune modulation offer hope for long-term remission or cure.
