GRAVES DISEASE: TREATMENT & PREVENTION

What is Graves' disease?

It is an autoimmune disorder where the immune system stimulates the thyroid to overproduce hormones (hyperthyroidism), causing symptoms like anxiety, rapid heartbeat, weight loss, and tremors.

Clinical trials

for Graves Disease help researchers develop better ways to prevent, treat, and possibly cure Graves Disease. Volunteers from all walks of life are essential to this progress.

*Stay informed,
stay evidence-driven.*

Who Can Join?

- People living with Graves
- People at risk for Graves
- People of all backgrounds and identities

Why Participate?

- Access to new treatments before they're widely available
- Help advance science and improve care for others
- Receive expert medical attention and regular health checkups
- Potential compensation for your time and travel

Safe. Confidential. Voluntary.

- Trials follow strict safety rules
- Your information is private
- You can leave the study at any time

Make a difference

IN GRAVES DISEASE RESEARCH.
