

ADVANCING CLINICAL CARE FOR GRAVES DISEASE

Current clinical research is shifting toward targeted therapies that address the underlying autoimmune cause of the disease rather than just the symptoms. Many of these trials are investigating monoclonal antibodies and other novel treatments.

Research is shifting toward targeting the underlying autoimmune mechanisms rather than just treating symptoms.

JOIN US IN MOVING THE FIELD

FORWARD

YOUR ROLE AS A CLINICIAN:

- Identify and refer eligible patients for ongoing Graves Disease trials
- Stay updated on the latest data to inform clinical decision-making
- Partner with research teams to expand access to cutting-edge therapies
