WHAT ARE GLP-1 AND GIP?

GLP-1 and GIP are natural hormones your body releases after you eat. They help regulate appetite, slow stomach emptying, and help your body manage blood sugar. Researchers are studying whether the investigational medication may provide another option for weight management in those with diabetes who have obesity or overweight.

Not everyone wants an injection.

While injectable weight-loss medications have helped many people, not everyone prefers injections or finds them convenient for long-term use. Researchers are evaluating an investigational once-daily (2 pill) oral medication for adults with Type 2 diabetes and obesity/overweight.
