MANAGING WEIGHT AND TYPE 2 DIABETES ISN'T ALWAYS EASY.

Explore a Clinical Research Study for Weight Management

Researchers are studying an investigational oral medication designed to work with two natural hormones involved in appetite and blood sugar regulation.

YOU MAY QUALIFY IF YOU:

- Are 18 years of age or older
- Have been diagnosed with Type 2 diabetes
- Have a Body Mass Index (BMI) of 27 kg/m^2 or higher
- Are currently managing your diabetes with stable treatment that does not include insulin

PARTICIPANTS MAY RECEIVE:

- Study-related care at no cost
- Nutritional guidance from a dietician
- Financial compensation up to $3,637

WHAT ARE GLP-1 AND GIP?

GLP-1 and GIP are natural hormones your body releases after you eat. They help regulate appetite, slow stomach emptying, and help your body manage blood sugar. Researchers are studying whether the investigational medication may provide another option for weight management in those with diabetes who have obesity or overweight.

Not everyone wants an injection.

While injectable weight-loss medications have helped many people, not everyone prefers injections or finds them convenient for long-term use. Researchers are evaluating an investigational once-daily (2 pill) oral medication for adults with Type 2 diabetes and obesity/overweight.
